

- The Monarch butterfly, one of North America's most amazing creatures, relies solely upon Milkweed for its survival. Female Monarch butterflies are drawn to Milkweed, the only type of plant they'll lay their eggs on. The toxins found in Milkweed, when ingested by caterpillars, create a defense mechanism that makes them unpalatable to predators.

Unfortunately, see Milkweed as an same toxins that may eaten. For many gardeners, an unwanted guest in their weeded out. Due to this on Milkweed, and the habitat to face, the Monarch butterfly in population since 2004 - to reverse this trend, more our gardens and landscapes.

many farmers and landowners unwelcome pest due to these endanger their animals if Milkweed is nothing more than flower beds that must be prevalent negative perspective loss that Milkweed continues has suffered a critical decline 2005. To stop, and even begin Milkweed must be added to Many others have already

started to do their part by planting more **Milkweed for Monarchs**, but much more is needed. You can join the movement and help to save the Monarchs by planting Milkweed! Parsons' Gardens has several types of Milkweed to choose from and we'd love to help you select the varieties that will perfectly fit into your outdoor space!

- Jay Parsons
